behind ZERONA

Low-level Lasers

The remarkable images above demonstrate the low-level laser's ability to emulsify adipose tissue. The pictures highlight the safe collapse of the rigid adipose cells and the secretion of triglycerides and fatty acid from the cells. This animation shows:

0 Minute
Healthy adipose cells

5 Minute
Fat droplets seeping from the cell

18 Minute
Collapse of adipose cell-emulsification

Developed by Erchonia Corporation, the world leader in low level laser therapy, ZERONA is applied externally, utilizing the patented and clinically proven Erchonia Laser Scanner. This patented method is what makes ZERONA not only revolutionary, but the only proven, non-invasive body slimming red laser procedure to effectively and painlessly target excess fat and create a slimming effect.

ZERONA works by using a low-level laser that operates at a wavelength of 635nm and emits no heat. Simply put, the laser works by stimulating adipocyte cells and emulsifying the fat within the cell. Once stimulated, a transitory pore is formed and the emulsified triglycerides and fatty acids are released into the interstitial space. Our bodies then remove the fat from the area and transport the fat from the area through the lymphatic system creating a slimming effect.

ZERONA not only targets fat to reduce inches in the goal area, this remarkable device has been proven to have a cascading (systemic) affect impacting adjacent cells. With ZERONA you can expect to lose inches not only in the targeted area of your waist, hips and thighs but in other area where fat exists, such as the arms, face and neck. Upon completion of yet another safe and effective clinical trial, Zerona-Z6 most recently received an Overall Body Circumference Reduction indication from the FDA. Zerona has been through a total of 5 Level 1 clinical trials.

Real Science

The meaning of Reduction

What does 3.72 inches really mean?

This is an important question to address for you to understand what an inch reduction like 3.72 inches means for your overall health. When assessing the fat reduction via bio-impedance analysis, patients losing 3.0 inches translates into approximately 4.0 lbs. of fat lost. The density of fat tissue is 1.9 lbs/L; therefore patients are losing close to **2.0 liters of fat**, which is equivalent to a 3.0 liter liposuction.

This is equivalent to 61½ cheeseburgers!

Real Results

What You need to know

① Does It Really Work?

Yes, by following the recommended guidelines for success, you can expect to experience a loss of 3.72 inches* or more from your waist, hips and thighs as demonstrated during clinical trials.

② Is It Safe?

Yes, there is no risk involved in using the ZERONA low-level laser therapy. Low-level lasers have been in use for 40 years without a single safety concern. ZERONA is 100% non-invasive. There is no bruising, no scarring, and no downtime. During the treatment you will feel no discomfort, and you can assume normal activities immediately following each treatment.

③ Where Does the Fat Go?

Our bodies remove the fat from the area and transport the fat from the area through the lymphatic system creating a slimming effect.

*Individual results may vary.
